Selective cleavage of the B–O bond or B–H bond in HBpin can be achieved by adjusting the pincer ligand of a phosphorus(III) compound guided by a combination of theoretical prediction and experimental verification. Theoretical calculations reveal that a pincer-type phosphorus compound with an [ONO]₃– ligand reacts with HBpin, leading to cleavage of the stronger B–O bonds ($\Delta G^\circ = 23 \dots$

Sally Price's group is concerned with modelling the intermolecular and intramolecular forces in organic molecules, such as pharmaceuticals, sufficiently realistically that they can be used for predicting the crystallization and solid state properties of the molecules. The group has been developing computational "Crystal Structure Prediction" (CSP) methods, to generate the crystal energy landscape, the set of crystal structures of an organic molecule which are thermodynamically plausible as ...
