The Material Point Method For

The material point method (MPM) is a numerical technique used to simulate the behavior of solids, liquids, gases, and any other continuum material. Especially, it is a robust spatial discretization method for simulating multi-phase (solid-fluid-gas) interactions. In the MPM, a continuum body is described by a number of small Lagrangian elements referred to as 'material points'. These material points are surrounded by a background mesh/grid that is used only to calculate gradient terms such as th

The Material Point Method. As one of the innovative spatial discretization methods, the Material Point Method is an extension to solid mechanics problems of a hydrodynamics code called FLIP which, in turn, evolved from the Particle-in-Cell Method. The motivation of the development was to simulate those problems, such as penetration, perforation, metal forming and cutting, which involve large deformations, the transition from continuous to discontinuous failure modes and the creation of new ...

Material Point Method - an overview | ScienceDirect Topics

Material Point Method (MPM) is a particle based method that represents the material as a collection of material points, and their deformations are determined by Newton's laws of motion. The MPM is a hybrid Eulerian-Lagrangian approach, which uses moving material points and computational nodes on a background mesh.

The material-point algorithm The particle-in-cell method, FLIP, combines the strengths of Eulerian and Lagrangian descriptions of the material. The Lagrangian description is provided by discretizing each body by a collection of material points, and the Eulerian description is based on a background computational mesh.
